Globalization: some stylized facts (not exaustive!)

R. Helg   LIUC 2015

What Is Globalization?

•The world is moving away from self-contained national economies toward an interdependent, integrated global economic system

• A convenient definition of Globalization for this course: it is the process of increasing international economic integration of markets.

• Note that from our definition I have left out other dimensions: cultural, political, military etc.

They are relevant, but the focus in this course will be mainly on the economic one.

Globalization: is it true?
(1950-2015,   1950=100;   volume data;   source:WTO)

Slide 1

### Attention: exports are measured on a gross basis, not value added one

**Figure 7. Value added in global exports, 2010**

$ Trillions

ESTIMATES

~19 — Global gross exports

~5 — "Double counting" (foreign value added in exports) — 28%

~14 — Value added in trade

Globalization 4: a new phase?

A group of economist (see Gene Grossman and Rossi-Hansberg, 2006 and the presentation by Richard Baldwin, 2006)) have introduced the idea that with outsourcing globalization has entered a new phase.

The idea is that in the first phase globalization has been characterized by a **first unbundling**: end of the necessity of making goods close to the point of consumption. In this first phase we had **trade in goods**.

Recently, started a **second unbundling**: the end of the need to perform most production stages near each other. In this second phase we have **trade in tasks.**
Globalization 5: migration

Chart 3
Net immigration into developed countries, 1960-2006
(Five-year moving averages, net immigration as percent of population)

a Traditional immigration countries comprise Australia, Canada, New Zealand and United States.
b Traditional emigration countries are composed of 18 western European countries: Austria, Belgium, Denmark, Finland, France, Germany, Greece, Iceland, Ireland, Italy, Luxembourg, the Netherlands, Norway, Portugal, Spain, Sweden, Switzerland and United Kingdom.

Globalization 6

Historical digression:

Fast economic growth is a feature of the last 200 years. It is a product of the capitalistic production system.

Globalization is an intrinsic feature of the capitalistic production system
(on this, see page 27 from Maddison, 2001)

Globalization and the capitalistic system of production

World GDP per capita
(1990 International Geary-Khamis dollars)

Source: Angus Maddison, Historical Statistics for the World Economy

Drivers of Globalization

Two major factors underlie the trend toward greater globalization:

• the **decline in barriers** to the free flow of goods, services, and capital (but not to free flow of people!) that has occurred since the end of World War II. This process has been facilitated by the emergence of **global institutions** (GATT/WTO, IMF etc.)

• **technological change**

Declining Trade and Investment Barriers

Some stylized facts:
- After WWII substantial reduction in trade barriers (tariffs and non-tariffs barriers)
- On average less developed countries are more protectionist than industrialized countries (IC)
- South-South trade is characterized on average by higher trade barriers than South-North trade
- IC have peaks of protectionism in some sectors (ie agriculture and textile and clothing) in which many emerging economies have a comparative advantage

Monetary Poverty

Extreme poverty around the world has been reduced since 1820 if we control for population increase. In absolute terms in has continuously increased between 1820 and 1980. After it has reduced

World Poverty 1a: World population with less than 1.08 US$ (PPP) per day (old estimates)

	1820	1929	1950	1960	1970	1980	1987*	1992	1998*	2005
%	83,9	56,3	54,8	44	35,6	31,5	28,3	23,7	23,4	17,2

World Income Inequality

Three different approaches to measuring inequality in the world

	Concept 1: unweighted inter-national inequality	Concept 2: weighted inter-national inequality	Concept 3: "true" world inequality
Main source of data	National accounts	National accounts	Household surveys
Unit of observation	Country	Country (weighted by its population)	Individual
Welfare concept	GDP or GNP per capita	GDP or GNP per capita	Mean per capita disposable income or expenditures
National currency conversion	Market exchange rate or PPP exchange rate (but different PPP concepts used)		
Within-country distribution (inequality)	Ignored	Ignored	Included
Results: - 1820-1980 - 1980-2000	Increase Increase	Increase Reduction	Increase Reduction

Source: adapted from Milanovic (2002)

World Income Inequality

World Income Inequality 1: the long run (mean logarithmic deviation)

source: Bourguignon-Morrison

Within group inequality — Between group inequality — Total inequality

World income inequality has continuously increased between 1820 and 1980.
Note the inversion in relevance of the two components: between 1820 and 1930 *within country inequality* has been the most important component of world income inequality. After 1930 the leading component has become *across country inequality*.

World Income Inequality

World Income Inequality 2: the last 30 years (mean logarithmic deviation)

source: Sala-i-Martin (2002)

Within group inequality — Between group inequality — Total inequality

In the last 20 years world income inequality has inverted its trend and started reducing. This evolution is mainly due to the fast convergence in per capita income between China (from 1980) and India (from 1990), on one side, and the developed countries, on the other.
Note also the increase in the role played by within country inequality.
